High Performance Computing for Engineering Applications Assignment 10

Date Assigned: November 19, 2013 Date Due: November 25, 2013 – 11:59 PM

The goal of this assignment is as follows:

- Getting familiar with OpenMP

Problem 1. Write a program that relies on OpenMP-enabled parallel programing to evaluate the integral

$$I = \int_{0}^{100} e^{\sin x} \cos(\frac{x}{40}) dx$$

Note that the value provided by MATLAB for this integral is I = 32.121040688226245. To approximate the value of I use the following extended Simpson's rule:

$$\int_{0}^{100} f(x) dx \approx \frac{h}{48} \Big[17 f(x_0) + 59 f(x_1) + 43 f(x_2) + 49 f(x_3) + 48 \sum_{i=4}^{n-4} f(x_i) + 49 f(x_{n-3}) + 43 f(x_{n-2}) + 59 f(x_{n-1}) + 17 f(x_n) \Big] + 48 \int_{0}^{100} f(x) dx \approx \frac{h}{48} \Big[17 f(x_0) + 59 f(x_1) + 49 f(x_2) + 49 f(x_3) + 48 \sum_{i=4}^{n-4} f(x_i) + 49 f(x_{n-3}) + 43 f(x_{n-2}) + 59 f(x_{n-1}) + 17 f(x_n) \Big] + 48 \int_{0}^{100} f(x) dx \approx \frac{h}{48} \Big[17 f(x_0) + 59 f(x_1) + 49 f(x_2) + 49 f(x_3) + 48 \sum_{i=4}^{n-4} f(x_i) + 49 f(x_{n-3}) + 43 f(x_{n-2}) + 59 f(x_{n-1}) + 17 f(x_n) \Big] + 48 \int_{0}^{100} f(x) dx \approx \frac{h}{48} \Big[17 f(x_0) + 59 f(x_1) + 49 f(x_2) + 49 f(x_3) + 48 \int_{0}^{n-4} f(x_i) + 49 f(x_n) + 49 f(x_n) \Big] + 48 \int_{0}^{100} f(x_n) dx = \frac{h}{48} \int_{0}^{100} f(x_n) dx = \frac{h}{48}$$

In the approximation above,

$$x_0 = 0$$
, $x_n = 100$, $h = 10^{-4}$, and $n = \frac{100 - 0}{h} = 10^6$.

This value of n goes to say that you divide the interval [0, 100] in 106 subintervals when evaluating I.

After implementing the code, you will have to run the code on Euler using

- One computational thread (sequential execution)
- Using OpenMP on either an Intel (up to 8 physical and 16 virtual cores) or AMD (up to 64 cores) per box. Try to squeeze as much performance as possible out of the available hardware.

Answer:

For AMD (upto 64 cores) on Euler26

Optimization flags	Serial timing	Parallel timing	Speed up
-o2 -ofast	157.307705 ms	6.7936 ms	23.16 times (approx)

For Intel (upto 16 cores) on Euler01

Optimization flags	Serial timing	Parallel timing	Speed up
-o2 -ofast	130.115226 ms	11.926627 ms	10.9 times (approx)

This shows that AMD processor perform faster in case of parallel timing but in Intel perform faster in case of serial timing.
